HEAT AND ENERGY SAVING IDEAS FOR THE NEW YEAR AND HOW WE CAN HELP!

Heating and cooling accounts for about 48% of the energy use in a typical U.S. home, making it the largest energy expense for most homes. The most common heating fuel is natural gas and its used in about 57% of American homes. A few things that can help reduce this cost and make your system more efficient is to install a programmable thermostat to set your heater back while you are sleeping or away. Also consider air sealing your home and adding insulation to your walls and attic.

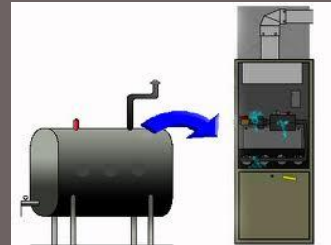

Last winter, heating a house with oil cost an average of \$1,700, while natural gas averaged less than \$900, according to the US Energy Information Administration. The year before, when oil prices peaked, oil heating cost an average of \$2,000; natural gas was again around \$900. Since 2002, oil heat has averaged 30% to 50% more than gas every year.

Converting from Oil to Gas

Natural gas is an efficient, safe, and reliable fuel source. It costs less than heating oil, and is one of the cleanest-burning fuels available. Converting to natural gas will reduce greenhouse gas emissions and save you money on your heating bill and converting from oil to gas is easier than ever.

Q: Why should I replace my system if it is over 15 years old and running good?

A. If your system is over 15 years old, it may only be 60% efficient. By replacing your old equipment, you could save money on your energy bill, have a system that works better and is more efficient and you could receive up to 35% tax free and get rebates up to \$2000.

Q: Why should your equipment be serviced every season?

A. Having your system properly cleaned and serviced can reduce your energy bill by up to 30% and will insure your system is running properly and has no damage and is running at peak efficiency.
